The more significant matches with motifs in the PROSITE database are also included but some of these may be fortuitous.

The length in codons is given for each CDS.

The length in codons is given for each CDS.

The length in codons is given for each CDS.

The length in codons is given for each CDS.

The position of possible ribosome binding site sequences are given where these have been used to deduce the initiation codon.

The position of possible ribosome binding site sequences are given where these have been used to deduce the initiation codon.

Gene prediction is based on positional base preference in codons using a specially developed Hidden Markov Model (Krogh et al., using a specially developed Hidden Markov Model (Krogh et al., program of Bibb et al., Gene 30:157-66(1984) as implemented at http://www.nih.go.jp/

Jun/cgi-bin/frameplot.pl. CAUTION: We may not have predicted the correct initiation codon. Where possible we choose an initiation codon (atg, qtg, ttg or (att)) which is preceded by an upstream ribosome binding site sequence (optimally 5-13bp before the initiation codon). If this cannot be identified we choose the most upstream initiation codon.

IMPORTANT: This sequence MAY NOT be the entire insert of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      abab; bldA regulation; cysA; cystathionine/methionine gamma-synthase/lyse; gntR-family; integrated element; korSA; lysR-family; membrane protein; phosphotyrosine protein phosphatase; pra; psAM2; ptpA; ssgA; thiamine biosynthesis; thlC; transcriptional regulator; trasA.

```

```
transcriptional regulator, len: 301 aa; previously sequenced as TR:053869 (EMBL:037580) S.coelicolor lysR-like protein (301 aa). Highly similar to SW:ARAB_STRAT (EMBL:037580), arab, Streptomyces antibioticus transcriptional regulatory protein (301 aa), fasta soores; opt: 1581 z-score: 1813.2 E(): 0, 80.3% identity in 300 aa overlap. Similar to many other transcriptional regulators. Contains probable helix-turn-helix motif at aa 17-38 (Score 1659, +4.84 SD). Contains Pfam match to PF00126 HTHL! Bacterial regulatory helix-turn-helix protein, lysR family and PS00044 Bacterial regulatory proteins, lysR family signature"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    /note="SCQ11.01c, hypothetical protein, partial CDS, len: 995 as: unknown function, previously sequenced as TR:0380 (EMBL:03780), S.coelicolor hypothetical protein ORF5 downstream of phosphotyrosine protein phosphatase (159 aa). Weak similarity to the N-terminus of TR:069888 (EMBL:AL02797) Streptomyces coelicolor hypothetical protein (172 aa). fasta scores; opt: 158 z-score: 206.4 E(): 0.00036, 46.2% identity in 65 aa overlap. gamma-synthase/lyse, len: 392 as; previously sequenced as SW.CYSA_STRCO (EMBL.U37580), cysA, S.coelicolor putative cystathionine gamma-lyses (392 as), previously sequenced as SW.CYSA_STRCO (EMBL.U37580), cysA, S.coelicolor putative cystathionine gamma-lyses (392 as), Enfiniar to many e.g. SW.MEGL_PSEPU (EMBL.D88554), mdcA, Pseudomonas putida methionine gamma-lyses (398 as), fasta scores; opt: 608 z-score: 653.6 E(): 4.5e-29, 36.9% identity in 404 as overlap. Highly similar to TR:053668 (EMBL.X91393) Streptomyces antibioticus hypothetical protein found upstream of the abaB gene (232 as) (87.1% identity in 232 as overlap). Contains Pfam match to PF01053 Cys_Met_Meta_PP, Cys/Met metabolism PLP-dependent enzyme and PS008688 Cys/Met metabolism enzymes pyridoxal-phosphate attachment site."

SITERARD.

The more significant matches with motifs in the PROSITE database are also included but some of these may be fortuitous.

The length in codons is given for each CDS.

Usually the highest scoring match found by fasta -o is given for CDS which show significant similarity to other CDS in the database. The position of possible ribosome binding site sequences are given where these have been used to deduce the initiation codon.

Gene prediction is based on positional base preference in codons using a specially developed Hidden Markow Model (Krogh et al., Nucleic Acids Research, 22(22):4768-4778(1994) and the FramePlot program of Bibb et al., Gene 30:157-66(1984) as implemented at http://www.nih.go.jp/

Jun/Cgl.bin/frameplot.pl. CAUTION: We may not have predicted the correct initiation codon. Where possible we choose an initiation codon (atg, gtg, ttg or (att)) which is preceded by an upstream initiation codon. Thosome binding site sequence (optimally 5-13bp before the initiation codon. If this cannot be identified we choose the most upstream initiation codon. If this cannot be identified we choose the sequenced clone. It may be shorter because we only sequence overlapping sections once, or longer, because we arrange for a small overlap between and overlaps cosmids E6 and E56 on the AseI-E genomic restriction fragment.

Some and a standard overlaps cosmids E6 and E56 on the contrapt of the contrap

The more significant matches with motifs in the PROSITE database are also included but some of these may be fortuitous. The more also included but some of these may be fortuitous. The length in codons is given for each CDS. Usually the highest scoring match found by fasta -o is given for CDS which show significant similarity to other CDS in the database. The position of possible ribosome binding site sequences are given where these have been used to deduce the initiation codon. Gene prediction is based on positional base preference in codons using a specially developed Hidden Markov Model (Krogh et al., Rucleic Acids Research, 22(22):4768-4778(1994)) and the FramePlot program of Bibb et al., Gene 30:157-66(1984) as implemented at http://www.nih.go.jp. CAUTION: We may not have predicted the jun/cg1-bin/framePlot.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            correct initiation codon. Where possible we choose an initiation codon (atg, gtg, ttg or (att)) which is preceded by an upstream ribosome binding site sequence (optimally 5-13bp before the initiation codon). If this cannot be identified we choose the most upstream initiation codon. If this cannot be identified we choose the most IMPORTANT: This sequence MAY NOT be the entire insert of the sequenced clone. It may be shorter because we only sequence overlapping sections once, or longer, because we arrange for a small overlap between neighbouring submissions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     /note="SCL2.01, hypothetical protein, len: >328 aa;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The more significant matches with motifs in the PROSITE database are also included but some of these may be fortuitous. The length in codons is given for each CDS.

The length in codons is given for each CDS.

Usually the highest scoring match found by fasta -o is given for CDS which show significant similarity to other CDS in the database. The position of possible ribosome binding site sequences are given where these have been used to deduce the initiation codon.

Gene prediction is based on positional base preference in codons using a specially developed Hidden Markov Model (Krogh et al., Nucleic Acids Research, 22(22):4768-4778(1994)) and the FramePlot program of Bibb et al., Gene 30:157-66(1984) as implemented at http://www.nih.go.jp/
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        correct initiation codon. Where possible we choose an initiation codon (aty, qty, ttg or (att)) which is preceded by an upstream cribosome binding site sequence (optimally 5-13bp before the initiation codon). If this cannot be identified we choose the most upstream initiation codon. If the cannot be the entire insert of the sequenced clone. If may be shorter because we only sequence coverlapping sections once, or longer, because we arrange for a small overlap between neighbouring submissions.
                                                                                                                                                                                                                                                                                                                                                                         amino acid transport integral membran protein; branched amino acid

Hopwood, [3] John Innes Centre, Norwich Research Park, Colney, Norwich, Norfolk NR4 7UH, UK On May 10, 2000 this sequence version replaced gi:4584464.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          are also included but some of these may be fortuitous.

The length in codons is given for each CDS.

Usually the highest scoring match found by fasta -o is given for CDS which show significant similarity to other CDS in the database. The position of possible ribosome binding site sequences are given where these have been used to deduce the initiation codon.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Bacteria; Firmicutes; Actinobacteria; Actinobacteridae;

jun/cgi-bin/frameplot.pl. CAUTION: We may not have predicted the correct initiation codon. Where possible we choose an initiation codon (atg, gtg, ttg or (att)) which is preceded by an upstream ribosome binding site sequence (optimally 5-13pb before the initiation codon). If this cannot be identified we choose the most upstream initiation codon. If this cannot be identified we choose the most imporrant: This sequence MX NOT be the entire insert of the sequenced clone. It may be shorter because we only sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     matches to entry PF00005 ABC_tran, ABC transporter and two Prosite matches to PS00017 ATP/GTP-binding site motif A (P-loop). ```
The present sequence is a DNA (ATCC 23345) encoding S. griseus SsgA protein. SsgA reduces branching and fragment septation and enhances fragmentation of mycellum in liquid culture resulting in lower viscosity of culture broths. Filamentous bacteria can be transformed with ssgA gene-containing plasmid to enhance the production of secondary metabolites such as, antibiotics, antitumour agents, immunosuppressive agents, hypocholesterolaemic agents, enzyme inhibitors, antimigraine agents, herbicides, antiparasitic agents, runniant growth promoters, bioinsecticides, receptor agonists and antagonists and blomass.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        91 gtcggcgatccgtatgccatccggatgacgttccaccttcccggcgatgcccctgtgacc 150

                                                                                                                                                                                                                   The present sequence is a DNA (ATCC 23345) encoding S. griseus Ssgh protein. SsgA reduces branching and fragment septation and enhances fragmentation of mycellum in liquid culture resulting in lower viscosity of culture broths. Filamentous bacteria can be transformed with ssgA gene-containing plasmid to enhance the production of secondary metabolites such as, antibiotics, antitumour agents, immunosuppressive agents, hypocholesterolaemic agents, enzyme inhibitors, antimigraine agents, hebbicides, antiparasitic agents, ruminant growth promoters, bioinsecticides, receptor agonists and antagonists and biomass.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         61 ttccgtattccggtggagctccgatacgaggtcggcgatccgtatgccatccggatgacg 120

```
The present sequence is a DNA (ATCC 21386) encoding S. goldeniensis SsgA protein. SsgA reduces branching and fragment septation and enhances fragmentation of mycelium in liquid culture resulting in lower viscosity of culture broths. Filamentous bacteria can be transformed with ssgA gene-containing plasmid to enhance the production of secondary metabolites such as, antibiotics, antitumour agents, immunosuppressive
                                                                                                                                                                                                                                                                                                 241 ggcgcggaccgcgccctcttccgtgcaggcgccccgccgctggtcgccttcctcgaccgc 300

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is a DNA (ATCC 23940) encoding S. netropsis SsgA protein. SsgA reduces branching and fragment septation and enhances fragmentation of mycelium in liquid culture resulting in lower viscosity of culture broths. Filamentous bacteria can be transformed with ssgA gene-containing plasmid to enhance the production of secondary metabolites such as, antitionics, antitumour agents, immunosuppressive agents, hypocholesteroleemic agents, enzyme inhibitors, antimigraine agents, herbicides, antiparasitic agents, ruminant growth promoters,

The present sequence is a DNA (ATCC 3004) encoding S. albus G SsgA protein. SsgA reduces branching and fragment septation and enhances tragmentation of mycellum in liquid culture resulting in lower viscosity of culture broths. Filamentous bacteria can be transformed with ssgA gene-containing plasmid to enhance the production of secondary metabolites such as, antibiotics, antitumour agents, immunosuppressive agents, hypocholesterolaemic agents, entreme inhibitors, antimigraine agents, herbicides, antiparaslic agents, runninant growth promoters, bioinsecticides, receptor agonists and antagonists and biomass.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   61 accgtcgatccgtacgcggtgcggctgacgttccacctccccggagacgcccggtcacc 120

This invention describes a novel method nucleic acid (I) and its encoded polypeptide (II) containing at least one region that encodes an enzymatic activity involved in biosynthesis of spinosyns. (I) are used (i) to identify, inactivate or modulate genes involved in the biosynthesis of (II): (ii) to generate a library of polyketide synthases; (iii) for adding forosamine or trimethylrhamnose to a spinosyn or polyketide apyrone; and (iv) for recombinant production of the corresponding enzymes, which are used for production of (II), their precursors or derivatives, including production of transgenic plants that express (II) and thus have increased resistance to insects. (I) are also useful as markers for sequencing of the Saccharopolyspora spinosa genome. (II) are macrolides with insecticidal, but not antibacterial, activity, and can also be used to raise specific antibodies, useful for identifying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              expression clones in a gene bank. Cells transformed with (1) may produce (II) at significantly increased levels or produce new derivatives of (II). This sequence represents a genomic DNA fragment of the S. spinosa genome which contains the coding regions for proteins involved in forosamine and trimethylrhamnose biosynthesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New nucleic acid encoding enzymes for spinosyn biosynthesis, useful for recombinant production of insecticidal spinosyns and their derivatives
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 45624 BP; 7933 A; 14913 C; 14940 G; 7838 T; 0 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention describes a novel method nucleic acid (I) and its encoded polypeptide (II) containing at least one region that encodes an enzymatic activity involved in biosynthesis of spinosyns. (I) are used (i) to identify, inactivate or modulate genes involved in the biosynthesis of (II): (ii) to generate a library of polyketide synthases; (iii) for adding forosamine or trimethylrhamnose to a spinosyn or polyketide aglycone; and (iv) for recombinant production of the corresponding enzymes, which are used for production of (II), their precursors or derivatives, including production of transgenic plants that express (II) and thus have increased resistance to insects. (I) are also useful as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           markers for sequencing of the Saccharopolyspora spinosa genome. (II) are marcholdes with insecticidal, but not antibacterial, activity, and can also be used to raise specific antibodies, useful for identifying expression clones in a gene bank. Cells transformed with (I) may produce expression against a gene bank of the standard with (I) may produce (II) at significantly increased levels or produce new derivatives of (II). This sequence represents a genomic DNA fragment of the S. spinosa genome which contains the coding regions for proteins involved in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New nucleic acid encoding enzymes for spinosyn biosynthesis, useful for recombinant production of insecticidal spinosyns and their derivatives
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      cacggcacggtgctcgccaccatgatcttcaacctggtagccccggcgggtgtgatcgcg 24584

SsgA reduces branching and fragment septation and enhances fragmentation of mycelium in liquid culture resulting in lower viscosity of culture broths. Filamentous bacteria can be transformed with ssgA gene-containing plasmid to enhance the production of secondary metabolites such as, antibiotics, antitumour agents, immunosuppressive agents, hypocholesterolaemic agents, enzyme inhibitors, antimigraine agents, herbicides, antiparastic agents, runinant growth promoters, bioinsecticides, receptor agonists and antagonists and biomass.

                                                                                                                                                                                                                                                                                                                                   ŏ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to the cloning and sequencing of the gene cluster encoding a modular type I polyketide synthase (PKS) enzyme involved in the blosynthesis of the macrolide antibiotic nystatin. The nystatin PKS is useful as antifulagal antibiotics. The present sequence is a Streptomyces noursel nysl DNA of nystatin PKS gene cluster.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           P-PSDB; AAE10125, AAE10126, AAE10127, AAE10128, AAE10129, AAE10130,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to the cloning and sequencing of the gene cluster encoding a modular type I polyketide synthase (PKS) enzyme involved in the biosynthesis of the macrolide antibiotic nystatin. The nystatin PKS is useful as antitiungal antibiotics. The present sequence is a Streptomyces noursel nystatin PKS gene cluster DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  83 gatacgaggtcggcgatccgtatgccatccggatgacgttccaccttcccggcgatgccc 142

```
The present sequence is a DNA (ATCC 23345) encoding S. griseus SsgA protein. SsgA reduces branching and fragment septation and enhances fragmentation of mycellum in liquid culture resulting in lower viscosity of culture broths. Filamentous bacteria can be transformed with ssgA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     gene-containing plasmid to enhance the production of secondary metabolites such as, antibiotics, antitumour agents, immunosuppressive agents, hypocholesterolaemic agents, enzyme inhibitors, antimigraine

Also describes are methods for the preparation and detection of hPPG-1. The present sequence encodes the Leishmania major PPG protein which is used in comparison with the hPPG-1 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     19 gcagaggtcatgatgagcttcctcgtctccgaggagctctcgttccgtattccggtggag 78

Sequences AAX37293-298 represent nucleic acids encoding alpha-amylase variants (AAY17904-Y17909). The variants are derived from the Pseudomonas sp. KO-8940-derived maltopentaose-forming amylase (Shida, O. et al., Biosci. Biochen, Biochen, Vol. S6, 76-80, 1992). The variants have a replacement of the 57th or the 130th amino acid residue in the sequence as compared to the wild-type. The sequences are deposited under the accession numbers FERM BP-6116, 6119, 6115, 6117, 6118 or 6114. The variants can be used to transform plants to produce maltopentaose. The enzymes prepared from the alpha-amylase variants produce maltopentaose in a high yield.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 4, A Sequence 5, A Sequence 7, A Sequence 7, A Sequence 9, A Sequence 1, A Sequence 11, A Sequence 11,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 1,
